Introduction

PSD6056-2P is a cost effective, high performance bi-polar two phase micro-stepping drive applying pure-sinusoidal current control technique. It is best suited for the applications that desired extreme low noise and heat. It operates well in an environment, where electricity supply experience instability and fluctuation.

The general pseudo-sinusoidal current control technology adopted by majority of the drive produced distorted sine wave, and current ripple, resulting in vibration, noise and motor heating. This results in motor degrading over time, reducing in motor performance and shortens the usage life.

With an automatic optimization speed control technique, the PowerStep series drive output is very stable, with almost zero vibration and noise, performing close to a servo system, allowing the motor to operate smoothly. That helps to fulfill a design requirement of low noise, low heat and high performance.

P1 Terminal Assignment

Signal	Function and Descriptions
PUL+	<u>Pulse or Step Input</u> TTL differential input with high-going pulse, 1 μs min width. For +12V or +24V operation, a current limiting resistor had to be pull up or connected in series from the PUL+ to the VCC.
PUL-	
DIR+	<u>Direction Input</u> Logic High = positive (CW) rotation—4.0 ~ 5.0V Logic Low = negative (CCW) rotation—0 ~ 0.5V
DIR-	The DIR signal must be stable for at least 5ms before the drive receives the first pulse.
ENA+	<u>Enable Input</u> Logic High = Drive Enabled Logic Low = Drive Disabled
ENA-	This input, if left unconnected, is recognised as Logic High by the drive, and it will be enabled.

B+, B-	<p>Series Parallel</p> <p>8 Leads Motor</p>

Wiring

R=0 if VCC=5V
 R=1K(Power>0.125W) if VCC=12V;
 R=2K(Power>0.125W) if VCC=24V;
